

## P06 JQueryMobile

1

In P02, we developed a responsive web page using only HTML and CSS. In this exercise, we are going to do the page using jQueryMobile components. There are the same conditions as before. Please use the following jQueryMobile components:

1. A header toolbar widget with a title (Connect 4) as well as a button „Settings“.
2. A two-column grid widget.

Both components are described in the official jQueryMobile (<http://demos.jquerymobile.com/1.4.5/>). A jQueryMobile grid can be made responsive by adding your own CSS class (my-breakpoint).

2

Try to improve the look and feel of the page. Here are some ideas:

1. By default, the toolbar widget has a black background. Try to change the color.
2. Limit the maximum width of the grid and center it, so that it looks good on very large screen sizes.
3. Improve the text labels from the player information.
